All Data Structures

Array

An Array is a collection of items stored at contiguous memory locations. The idea is to store the multiple items of the same type together.

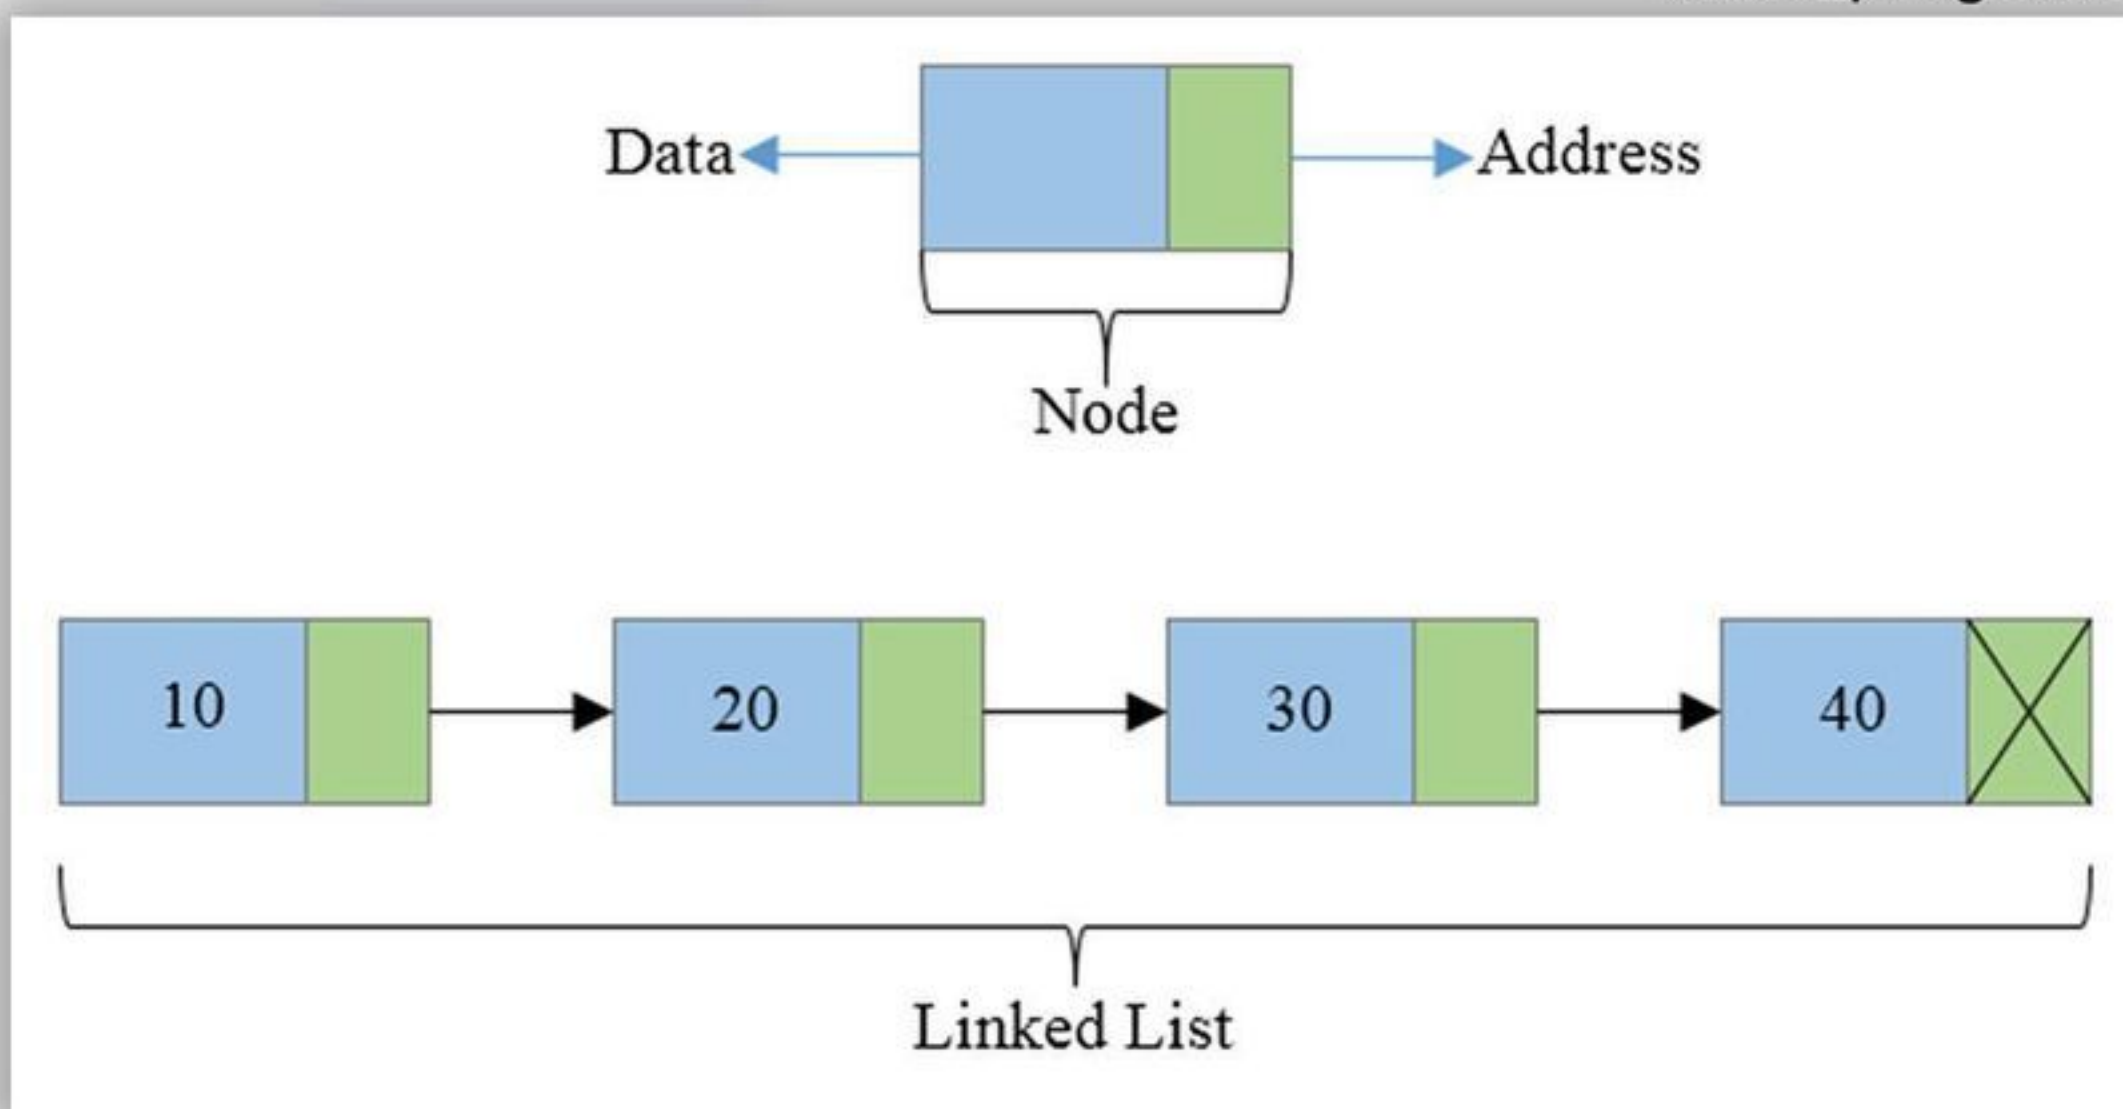

learn_programo

Linked List

A Linked List is a linear data structure, in which the elements are not stored at contiguous memory locations. It consists of nodes where each node contains a data field and a link to the next node in the list.

learn_programo

Graph

A Graph is a non-linear data structure consisting of vertices and edges. The vertices are sometimes also referred to as nodes and the edges are lines or arcs that connect any two nodes in the graph.

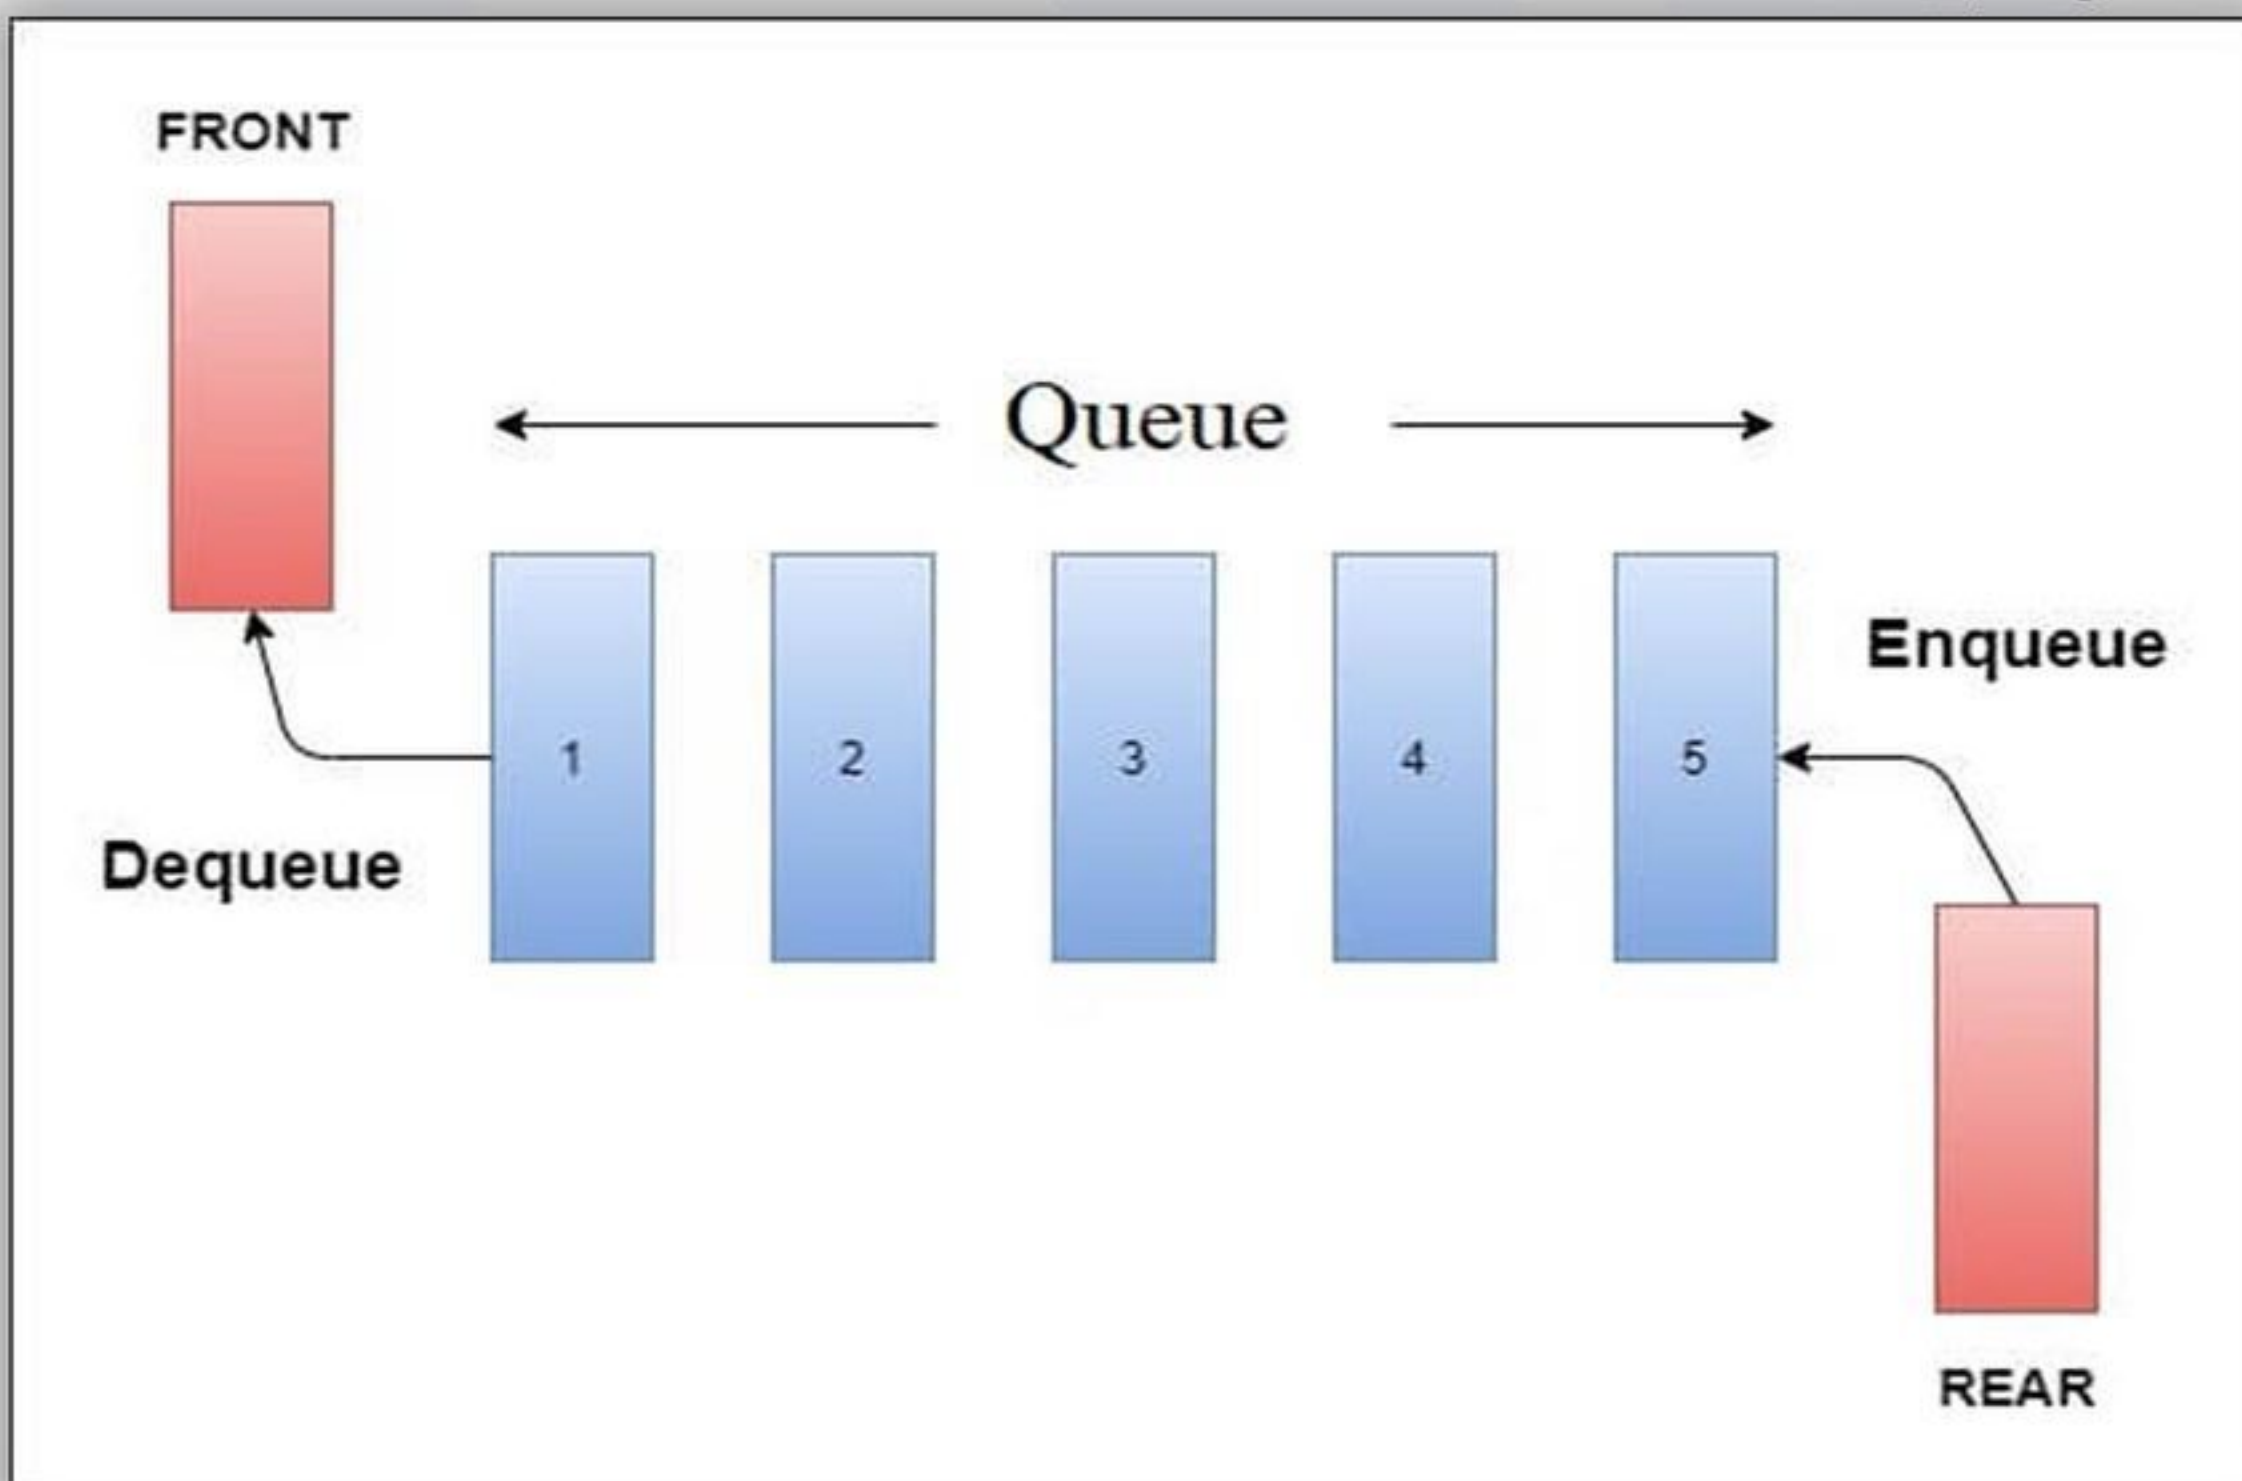

learn_programo

Queue

A Queue is defined as a linear data structure which is open at both ends and the operations are performed in First In First Out (FIFO) order. The element which is first pushed into order, the operation is first performed on that.

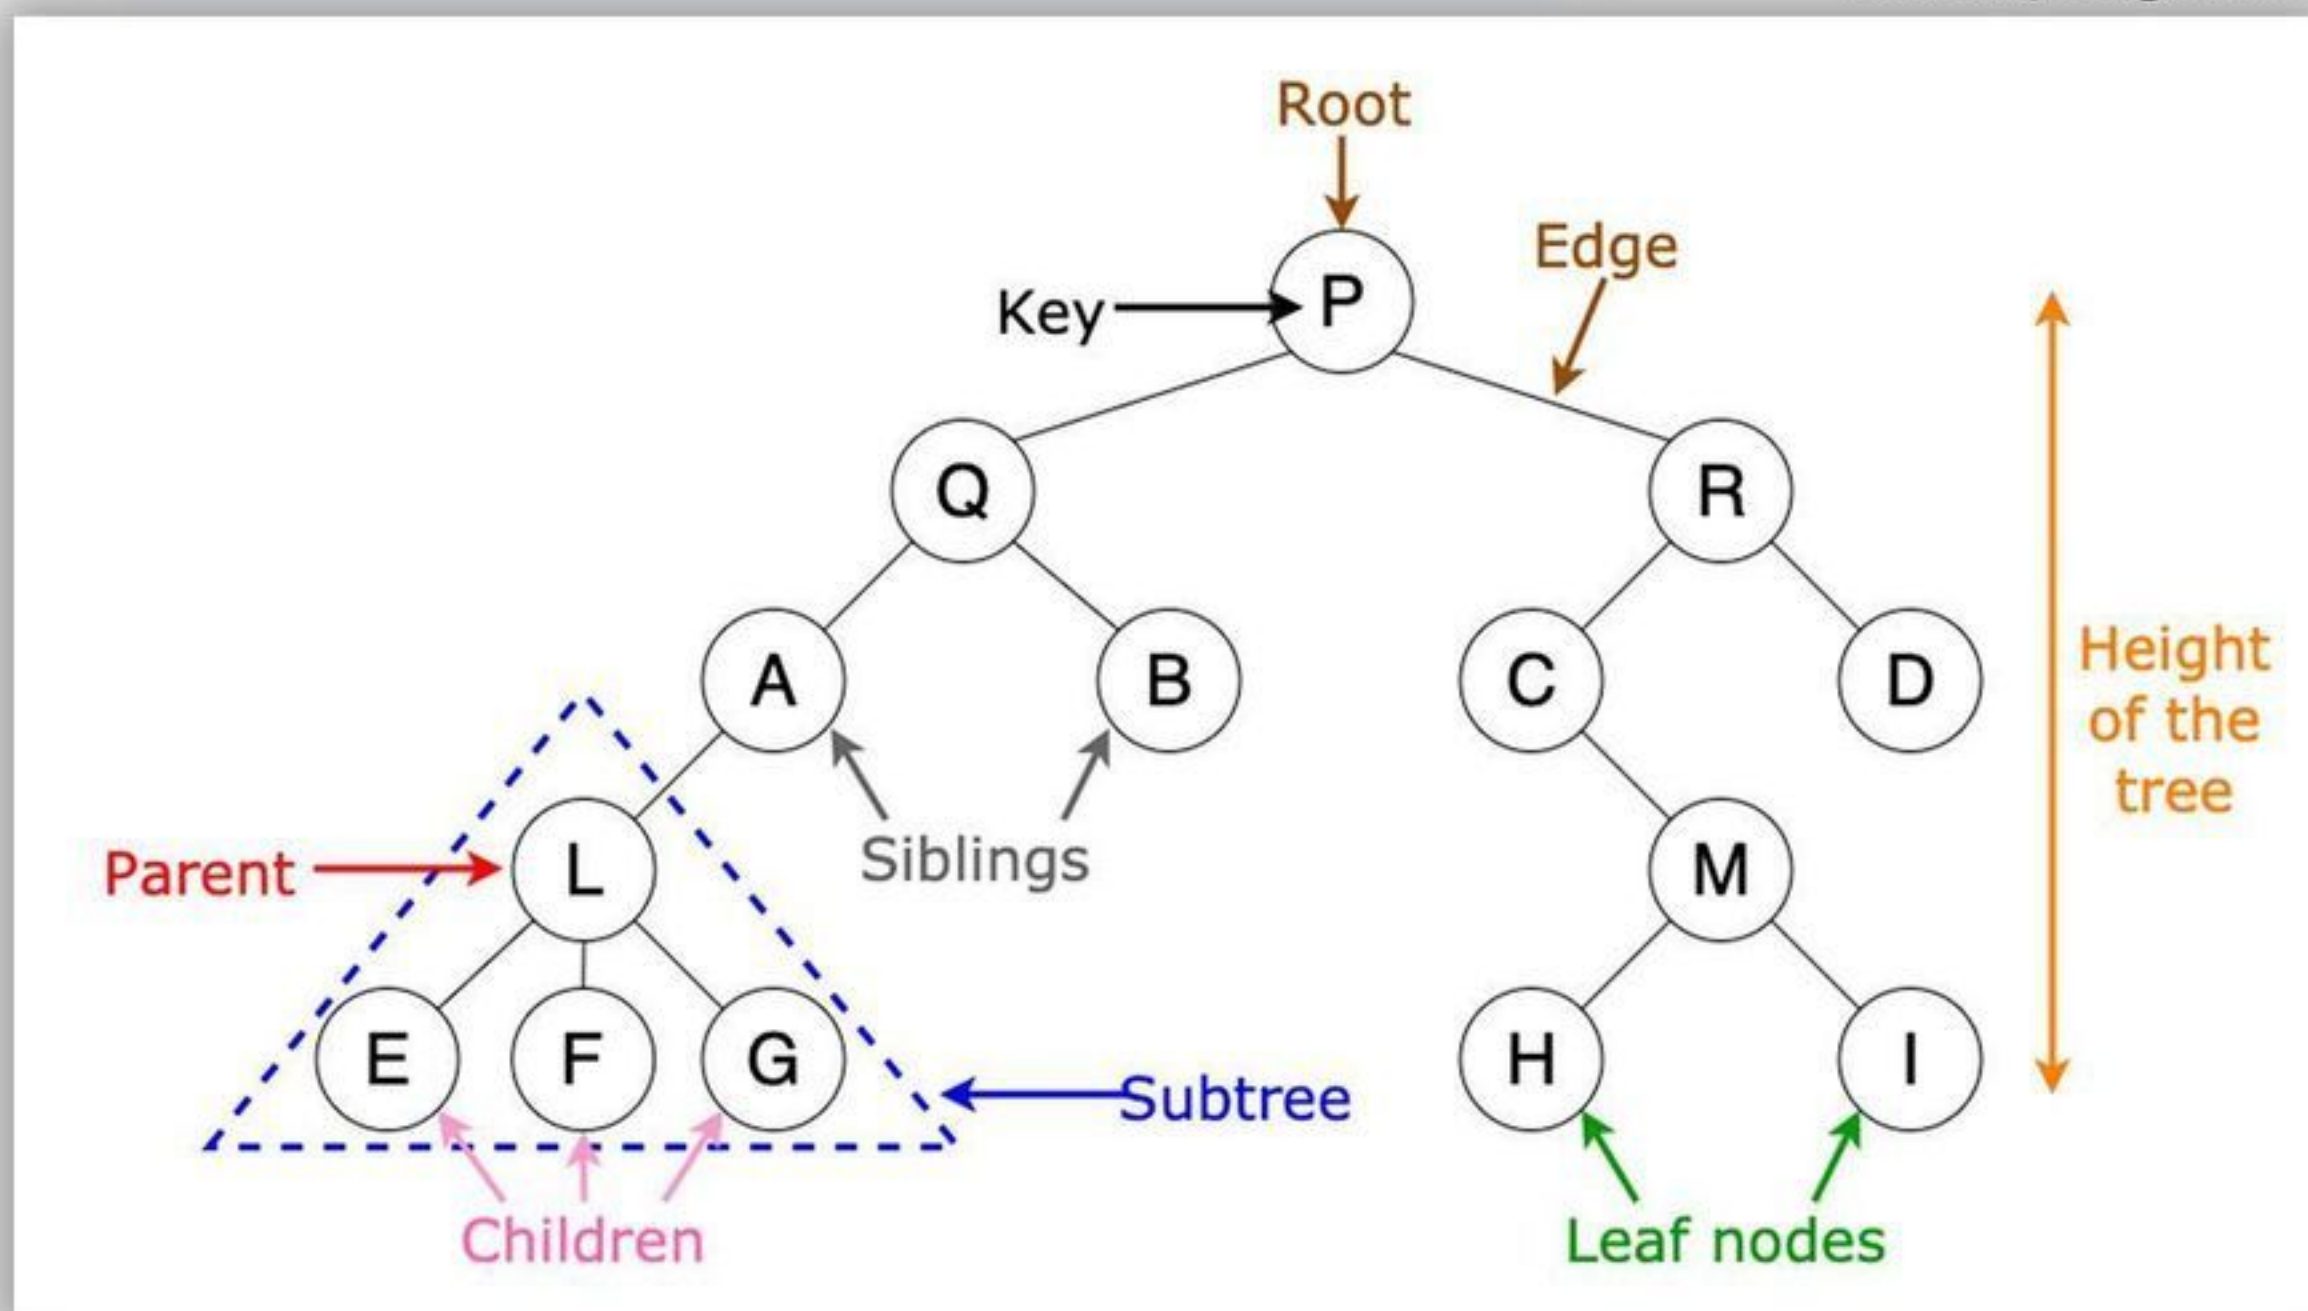

learn_programo

Tree

A Tree is a non-linear hierarchical data structure that consists of nodes connected by edges. A node is an entity that contains a key or value and pointers to its child nodes.

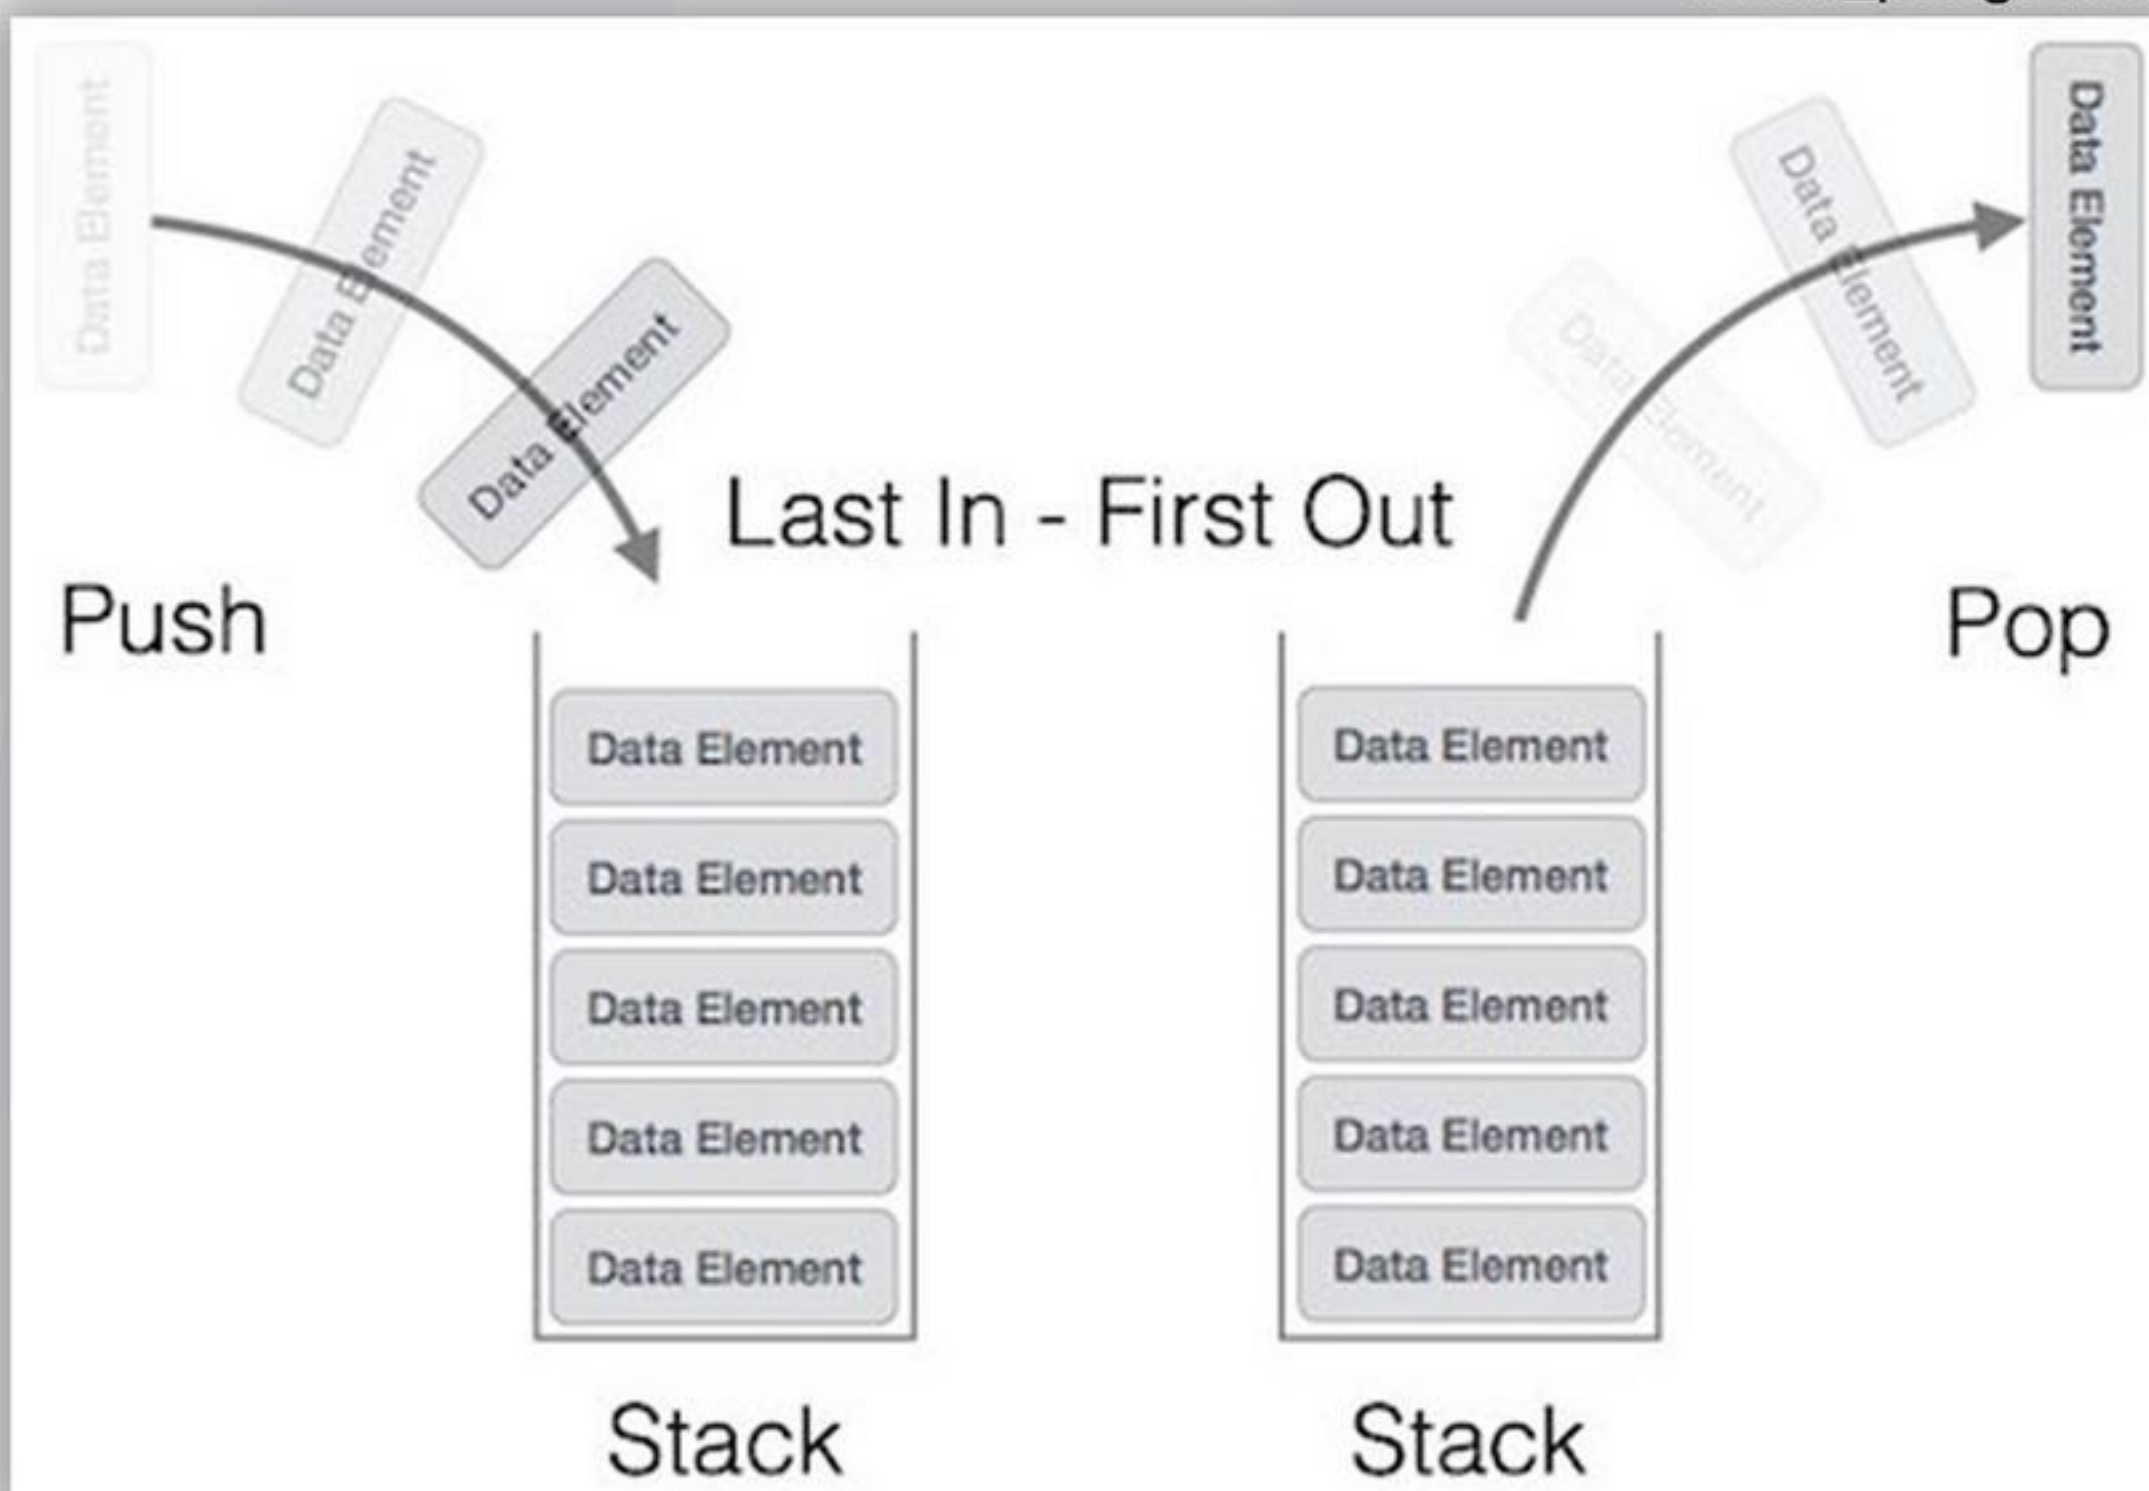

learn_programo

Stack

Stack is a linear data structure which follows a particular order in which the operations are performed. The order may be LIFO (Last In First Out) or FILO (First In Last Out).

learn_programo

Hash Table

Hash Table is a data structure which stores data in an associative manner. In a hash table, data is stored in an array format, where each data value has its own unique index value.
